After spending a few weeks checking out various publishers and a plethora of publishing options, Chris Coyer and I decided to go DIY-route and publish the book ourselves as The book is called Excavation in WordPress, and is due out in late summer or early fall this year. It will be packed full of juicy WordPress goodness and I hope you check it out when it's released. In the meantime, while we're busy working behind the scenes to make the book the best that can be, we've launched a diW accompanying site that focuses on WordPress, the book, and how to take your WordPress-powered sites to the next level. Here's a screenshot of the site that is on DigWP.com: DigWP.com site is still a bit rough around the edges, but we wanted to get started and start sharing some sweet WordPress tips and tricks while the book is being developed. Chris and I are both excited to have an exclusive outlet to share all things WordPress, so if you're interested, be sure to check it out and grab the feed! I will still be posting WordPress related articles and information here in the perishable press, but most of my WordPress content will now be pumped directly into DigWP.com. I'm absolutely thrilled to have this opportunity to work with Chris, and plan on making the most of it by pouring as much WordPress and web development knowledge as possible into the new DigWP site, and of course the book as well. The book will include a thorough study of WordPress, including many topics that appear on the site. Take a drink and check it out! :) Easily hands down the most common thing I find myself explaining to WordPress users is how to troubleshoot WordPress in order to find the cause of any problem. And it makes sense if you think about it. WordPress and all its plugins and themes are made of code. And the code is a complicated thing. The more code you add to your site, the more likely you are to make mistakes and problems. And when they do, it can be confusing and frustrating for the average user. Book updates! Normally, when we check to see if a regular WP Post falls into a specific category, we can use WordPress in\_category. But it doesn't work with custom mail types. Use has\_term instead to check whether PPC refers to a specific term in customs taxonom. People often ask me whether it is safe to run plugins that are not tested with the latest version of WordPress. And that's a good question, because the software in general is what you want to keep the current and updated with all the latest. For WordPress plugins however, there are many plugins that just don't have to be updated with every new version of WordPress. This year's Yay is the 7th birthday of our pro WordPress plugin site Plugin-Planet.com. To celebrate this event, we are handing out 7 free copies of our premium WordPress plugins! I get a bunch of emails asking what happened to Custom Fields meta-boxing on the Edit Posts screen. They are hidden by default with the new block editor, so what questions like, do I need to install a plugin to get them back? No, you don't know. To view the custom fields for any post, click three dots in the top right corner of the screen, and then go to the options. There you will find a check to custom fields (under advanced panels). Scroll down and you'll see the Custom Fields meta field. For a long time, Premium WordPress plugins and themes were sold as a one-off payment. So, for example, if you want to buy a new WordPress theme, you would make one purchase and own the theme indefinitely, without future payments due. Then somewhere along the way, repetitive pricing models became popular. These days, it is very common for themes and plugins to be sold through repetitive payment schemes. So, for example, if you want to use some awesome pro plugin or theme, you pay an annual or in some cases a monthly fee. WordPress plugins that clean after themselves clean an amazing sauce. If you are developing a plug-in that adds any data to the WordPress database, it is important that the plug-in removes any unwanted or unused data if and when the plug-in is ever blocked. This complete guide explains the useful methods for this with a powerful and convenient uninstall.php file. We have Black Friday/Cyber Monday sales on our Premium WordPress Plugins! Save 30% on lifetime licenses for such amazing plugins as USP Pro, Barbecue Pro, Blackhole Pro and more. To save money, apply the coupon code BLACKFRIDAY2019 at the time of checkout. This is a once-a-year event that expires on December 31! Sweet Friday goodness: the same coupon code works for any of our WordPress books or combos on perishable press books :) WordPress provides an option called Automatically Close Comments on Articles Over x Days. It's really really really to stop spamming on old blogs. The problem is that when you turn on the settings, there's no way to override individual posts. So I wrote a simple lightweight plugin that lets you override the automatic closing settings and leave comments open on any posts you want. Thank you WPKlik for the interview! In which I discuss my favorite projects, WordPress, Gutenberg and JavaScript development, the creation of secure WordPress sites, and more fun web theme developers :) There are many ways to add user-generated content to your WordPress channels. If you're not using the plugin, you can simply add a snippet of code to your theme's functions.php file. In most cases, I think there will probably be a plug-in route the easiest way to add custom content to your WordPress RSS/channels. Just install, activate, add content and make. But for wordpress developers and designers who want more fine-grained control, this article explains how to add custom feed content software using the WP API. So whether you need to add text copyright, advertising, hyperlinks, or virtually nothing at all, this post explains how to do it.
